

Lens support for Fx40 and Fx400

To support the lens on motion-based simulators

The lens support kits are designed to be mounted in front of the lens to support the lens on motion-based simulators. It is designed to improve the stiffness of the entire projection system creating a rigid bridge between the lens, internal lenses, all through the structure/engine with prism and DMD. The result is that the whole structure moves harmonically together contributing to a higher image robustness. Blend plates can be mounted in front using the available mounting points.

The lens support kits are available for the following lenses:

- EN61 R9802701
- EN63 R9802702
- EN66 R9802703
- EN76 R9802704
- EN83 R9802705
